Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        APPLICANT: Zavada, Jan
APPLICANT: Zavada, Jan
APPLICANT: Pastorekova, Silvia
APPLICANT: Pastorekova, Silvia
APPLICANT: Pastorek, Jaromir
TITLE OF INVENTION: MN Gene and Protein
NUMBER OF SEQUENCES: 96
CORRESPONDENCE ADDRESS:
ADDRESSE: Leona L. Lauder
STREET: 369 Pine Street, Suite 610
CITY: San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 65, Application US/08787739 Patent No. 6027887 GENERAL INFORMATION:

Patent No. 594888
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
CITY: Washington
STATE: D.C.
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Sequence 69, Application US/08454557C
Patent No. 5830670
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qy 10842 ACCATGCCCGCTAATTTTGTATTTTTAGTAGAGACAGGGTTTCACCGTGTTGGCCAGG 10901

See XO5250 for corresponding normal gene sequence
In the defective LDL receptor gene the deletion ocurred between two
all repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           See X05248 for corresponding normal gene sequence. In the defective LDL-receptor gene the deletion ocurred between two alu-repetitive sequences, that are in the same direction, the deletion eliminates exons 13 and 14 and changes the reading frame of the resulting spliced mRNA.

See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
all-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                    /organism-_taxon:9606"

A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences could be stranded DNA) which comprises one of the 7837 "GS" sequences user obtained from 3'-directed cDNA libraries prepared sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end ranslated sequence is unique to a particular mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs. In the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 34 A; 26 G; 15 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           27591 ATTGCTTGAACCCAGGAGGCGGAGGTTGCAGTGAGCCGAAATCGCGCCCACTGCACTCCAG 27650
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
A single-stranded DNA for its complementary strand or the corresp.

Couble-stranded DNA, which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNA hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22247 TTTCTTTTTCTGAGACGGAGTCTTGCTCTGTCGCCCAGGCTGGAATGCAGTGGCACAATC 22306
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100 TTTGTTTGTTTCAAACAGAGTGTCACTCTGTCACCCAGGCNGGAGTGCAANGGTGCAATC 41

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 [83 sequences double-stranded DNA) which comprises one of the 7837 [83 sequences of given in T19001-T25687 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library captured (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 25 G; 23 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21451 TTATTTTTTTTTTGAGTCAGAGTCACACTCTGTCGCCCAGGCTGGAGTGCAGTGCGTGA 21510

                                                                                         A single-stranded DNA, which complementary strand or the corresp.

C double-stranded DNA, which comprises one of the 7837 "GS" sequences

C given in T19001-T26837 and which is able to hybridise to part of

the man genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

sequences were obtained from 3'-directed cDNA was intilated from the

C from various human tissues; synthesis of cDNA was intilated from the

3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

untranslated sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

c all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

c is constructed as oa st or reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

cetermined (esp. using primers and probes derived from the GS

sequences) as a means of diagnosing abnormal cell function or for

crecognising different cell types.

C A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22239 TTTTTTTTTTTTTTTTTTGAGACGGAGTCTTGCTCTGTCGCCCAGGCTGGAATGCAGTG 22298

Claim 1: Page 914: 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

C double-stranded DNA) which comprises one of the 7817 "Gs" sequences

Given in T19001-T26837 and which is able to hybridise to part of

C flow arious DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

C from various human tissues; synthesis of cDNA libraries prepared

C from various human tissues; synthesis of cDNA libraries prepared

C 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

C untranslated sequence is unique to a particular mRNA species, almost

C all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

CC different mRNAs in the particular tissue from which it was derived.

CC determined (esp. using primers and probes derived from the GS

C sequences) as a means of diagnosing abnormal cell function or for

S Sequence 87 BP; 35 A; 21 C; 16 G; 13 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T28837 and which is able to hybridise to part of human genomic DNA, cDNA orm RNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human biallelic polymorphic DNA fragment EST98276a.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268 The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in c.g. forensies, paternity testing or for phenotypic typing for diseases such as agammiglobulinemia, diabetes insipidua, lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aidrich syndrome, Fabry's disease, familial spherocytosis, on Willebrand's disease, tuberous sclerosis, hereditary hemorrhagic telangiectssia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous such autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microcypanisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, and see indurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27408 GTGGCTCACACCTGTAATCCCAGCACTTTGGGAGGCCAAGGTAAGCAGATCACTTGAGGT 27467

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented conNas hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
drugs or therapeutic treatments. The isolated polymorphic nucleic acis segments can also be used to produce medicaments for the treatment or

The Wew isolated nucleate actus segments. Item the number yencer testing or phenotypic typing for disease

T determining polymorphic forms for use in e.g. forensics, paternity

T testing or phenotypic typing for disease

PS Claim 1: Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

CX 09121-X10268 The base occupying the polymorphic site is indicated by

CX 09121-X10268 The base occupying the polymorphic site is indicated by

CX of appropriate IUPAC-IUB ambiguity code. These fragments can be used in

CX of a propriate IUPAC-IUB ambiguity code. These fragments can be used in

CX of a forensics, paternity testing or for phenotypic typing for diseases

CX ouch as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome,

CX of a gammaglobulinemia, familial colonic polyposis, Enlers-Danios

CX of a procytosis, von Willebrand's disease, hereditary

CX syndrome, osteogenesis imperfects, acute intermittent porphyria,

CX syndrome, fertility, and susceptibility or receptivity to particular

CX concert can also be used to produce medicaments for the treatment or

CX syndromes of such account of produce medicaments or have a mean or account or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-MAR-1999 (first entry)
Human biallelic polymorphic DNA fragment EST98276b.

// note="Vector: pawp10; Site_1: Not1; Site_2: EccR1; 1st strand cDNA was primed with oligo(dT)17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to EccRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pawp10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman." I others

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note-"vector: paMP10; Site_1: Not1; Site_2: EcoRI; Ist Strand cDNA was primed with oligo(dT)17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected cells histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of FCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nk42bil.sl NCI_CGAP_GC2 Homo sapiens cDNA clone IMAGE:1016157 3' similar to contains Alu repetitive element;, mRNA sequence.
